Hostinger Build Stack Standard

Zawadie Solutions | Reference for every new solution | Version 1.0, 23 October 2026

1. OUR HOSTING PLAN

Item	What we have
Plan	Hostinger Business / Unlimited web hosting (shared, hPanel)
Included	50 GB NVMe, unlimited websites and mailboxes, free domain for 1 year, daily backups, CDN, WordPress, Node.js
Key limits	No root access. Node.js: 5 sites, 120 process limit, 120-second request timeout, no WebSockets, no always-on workers

2. APPROVED STACK (USE THIS FOR EVERY BUILD)

Layer	Standard	Rule
Backend runtime	Node.js 20 or 22 LTS (Express or Fastify), one app per Node.js site	Never Python. Max 5 Node.js sites on this plan.
Frontend	HTML, CSS, JS or React/Vite built to static files; Tailwind optional	Build locally or in CI; serve the static output.
Database	MySQL / MariaDB (InnoDB), managed in phpMyAdmin	One database per solution; use mysql2 with parameterised queries.
Scheduled jobs	hPanel Cron Jobs running a Node.js script	Runs in UTC, 30-minute cap; load env vars explicitly in the command.
AI features	Call external APIs (e.g. Open AI, Claude API) from the Node backend	No local models or Python ML libraries. Keys stay server-side.
Email	Plan mailboxes via SMTP with Nodemailer	Unlimited mailboxes included; transactional volume stays modest.
Integrations	REST and inbound webhooks over HTTPS (CRM, Slack, Sheets)	Respond fast; push heavy work to a cron job.
Files and storage	50 GB NVMe on server disk; uploads in a non-public folder	Large media goes to an external bucket.
Deployment	GitHub repo linked to hPanel Node.js deploy, or zip upload	Config via environment variables, never committed to Git.
Security and ops	Free SSL, bcrypt for passwords, daily backups, CDN included	Test a restore once per project.

3. DO NOT USE ON THIS PLAN

Avoid	Reason
Python, Flask, Django, FastAPI	Needs root access, which is only available on VPS.
PostgreSQL, MongoDB, Redis	Not offered here; use MySQL instead.
WebSockets, always-on workers, queues, bots	Not supported; processes stop on restart. Use cron jobs or polling.
Requests longer than 120 seconds	Stopped by the server; split into smaller jobs.
Docker, Java, root-level installs, SSR-heavy React	Require VPS hosting.

4. PRE-BUILD CHECKLIST

1. Does every part run on Node.js and MySQL? If anything needs Python, stop and redesign.
2. Is every long task handled by a cron job instead of a request?
3. Does it fit in the Node.js limits (5 sites, 120 processes, shared memory)?
4. Are secrets in environment variables, with a working backup and restore?

5. WHEN TO MOVE TO A VPS

Move only if a solution truly needs Python, PostgreSQL, WebSockets, background workers or more than 5 Node.js apps. Record the reason, then plan it as a separate VPS project.
